Slide 17

Supplier follow-up takes the owner's attention

40 ordered. 30 received.

RM28 shortage flagged

Scattered order details

Phone calls, messages and spreadsheets need cross-checking.

Replies in several languages

Dates, quantities and prices can change inside a message.

Exceptions are easy to miss

Late deliveries and short shipments need timely action.

Original prototype screenshot. Synthetic case: 10 missing loaves × RM2.80 = RM28.

Built for small food retailers in Malaysia

Target users

(Pengguna sasaran)

The owner

Places orders, checks exceptions and approves important changes.

Store staff

Records deliveries and reports the quantity received.

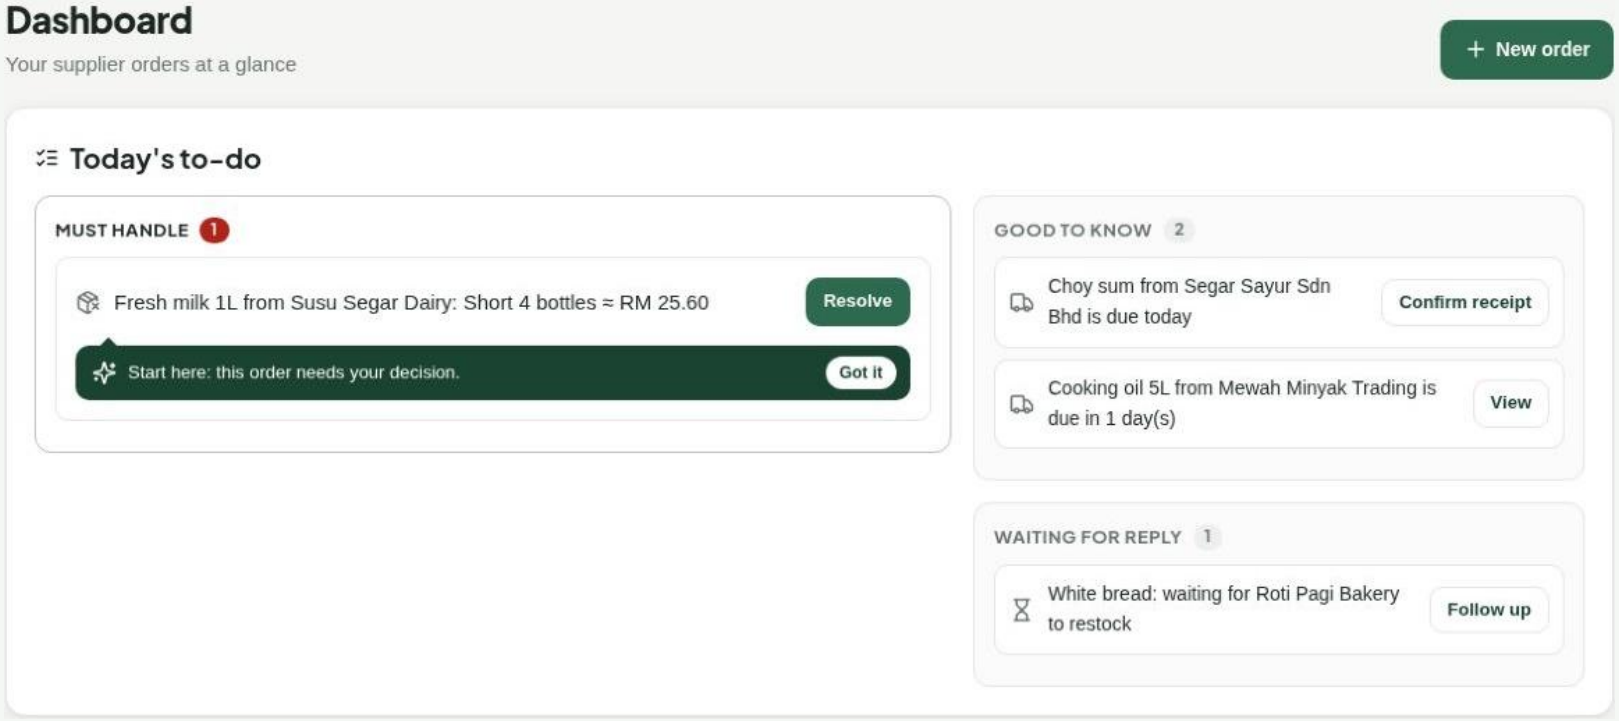

A typical procurement day

1. Place the supplier order
2. Wait for a reply or delivery
3. Check what actually arrived
4. Resolve missing goods or changes

Primary scope: supplier purchase orders for Malaysian food retailers.

One dashboard puts exceptions first

A multilingual procurement-tracking module designed for Orbyte

Must handle

Late orders and quantity mismatches.

Good to know

Upcoming deliveries.

Waiting for reply

Restock or negotiation in progress.

Live website capture. Orbyte account integration and WhatsApp communications are simulated.

Why Sudahsampai

Five design strengths for everyday supplier follow-up

01	**Multilingual replies**	English, Bahasa Melayu and Chinese become comparable order fields.
02	**Shortages shown in RM**	Quantity gaps become an amount the owner can assess.
03	**Exceptions first**	Urgent issues appear ahead of routine delivery updates.
04	**Owner approval**	Staff record receipt. The owner approves important changes.
05	**Orbyte fit**	A focused procurement module designed around shared platform services.

Demonstrated design strengths. Real Orbyte and messaging connections remain simulated.

Five-step automation workflow

1 Trigger

A reminder date, overdue order or supplier reply starts the workflow.

2 Read data

Read the order, quantities, prices and supplier message.

3 Identify exceptions

AI extracts fields. Rules compare them with the order.

4 Merchant approval

The owner reviews important exceptions and chooses the response.

5 Outcome and log

Update the order state and record the action, role and time.

Matches the five-step proposal: trigger, data, judgement, approval, outcome and log.

A shortage is flagged and marked for restock

Short delivery

(Penghantaran tidak mencukupi)

40 ordered **30 received** **RM28 gap**

Staff logs receipt
Records 30 loaves received.

System flags the gap
Highlights the 10-loaf difference.

Owner marks restock
Sets the order to waiting for restock.

Status and log update
Order waits for replenishment.

Synthetic case. Restock status and log shown. WhatsApp messaging is simulated. RM28 is not recovered savings.

AI reads replies and rules identify exceptions

Generative AI

(AI generatif)

Supplier reply in Bahasa Melayu

“Bos, lori rosak. Jumaat baru sampai.”

Example meaning: the truck broke down. Delivery will arrive on Friday.

AI extraction

Reads the new delivery date, quantity and price when present.

Rule comparison

Checks extracted values against the purchase order.

Decision boundary

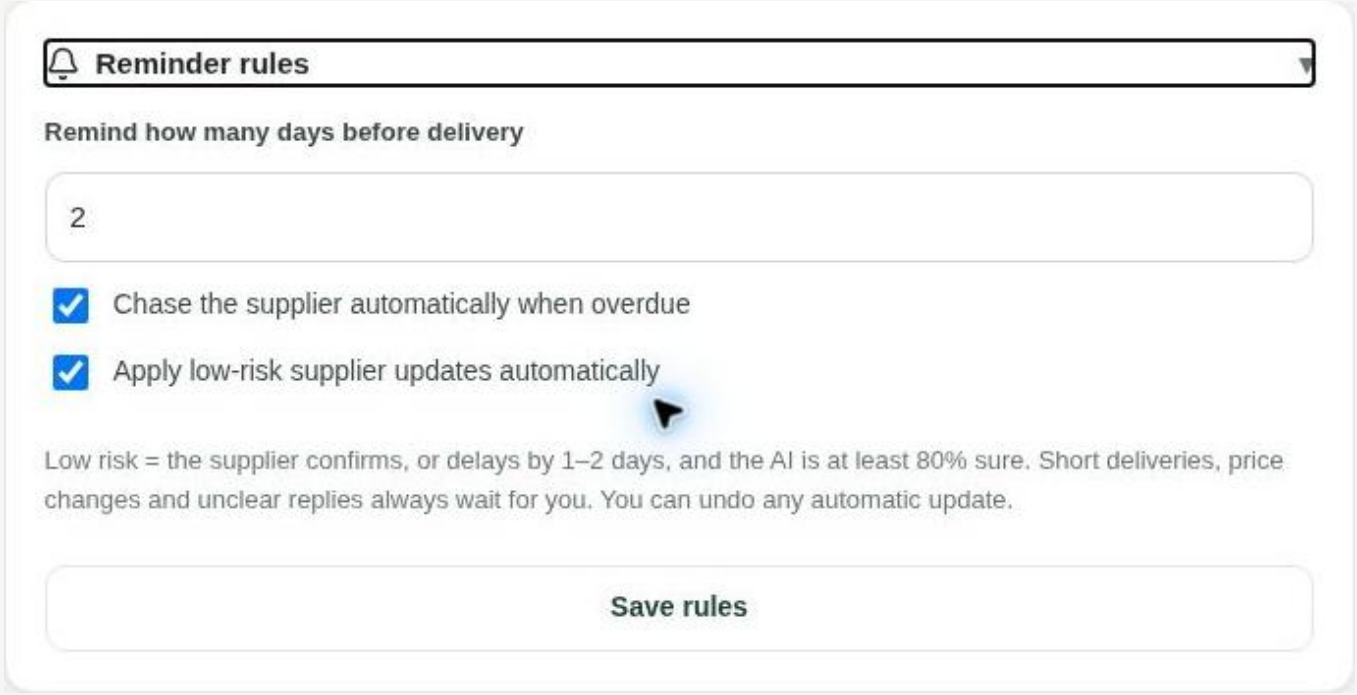

The owner handles important changes. AI does not approve them.

DeepSeek powers the live demo. Relative dates use order context. Example message is synthetic.

Routine updates follow owner-defined rules

Reminder rules

(Peraturan peringatan)

Before delivery

Choose how many days ahead to remind.

After the due date

Enable automatic supplier chasing.

Low-risk auto-updates

Optional confirmations or 1–2 day delays. AI confidence must be at least 80%.

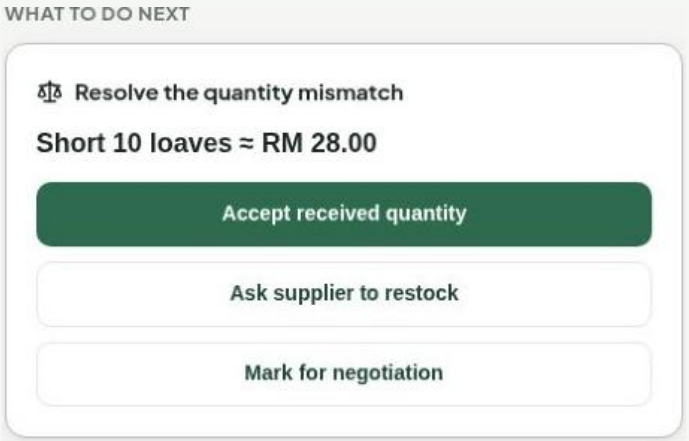

Shortages, price changes and unclear replies need approval. Auto-updates can be undone.

Owner approval and traceable decisions

Approval and audit log

(Kelulusan dan log audit)

Action	Staff	Owner
Log a delivery	Yes	Yes
Approve an exception	No	Yes
Revert an update	No	Yes

Owner resolution options

Owner decisions remain traceable in the order-level activity log.

A filtered log preserves the shortage decision

Activity log

(Log aktiviti)

Filter by order number 4 Filter Show all Order #4: 8 entries

SIMULATED DATE	TIME (MALAYSIA)	ROLE	ACTION	ORDER	DETAIL
2026-10-22	2026-10-23 22:45:44	Owner	Mismatch	#4	#4 White bread (Short 10 loaves (ordered 40, received 30) ≈ RM 28.00): owner asked the supplier to restock
2026-10-22	2026-10-23 22:45:35	Owner	Mismatch	#4	#4 White bread (Short 10 loaves (ordered 40, received 30) ≈ RM 28.00): owner asked the supplier to restock
2026-10-22	2026-10-23 22:45:26	Owner	Mismatch	#4	#4 White bread (Short 10 loaves (ordered 40, received 30) ≈ RM 28.00): owner marked for negotiation

Order #4 shows who acted, when they acted and what changed.

Orbyte platform fit and credit model

Orbyte fit by design	Sudahsampai module
Accounts and user roles	Supplier purchase orders
Communications framework	Follow-ups and reply parsing
Approval and audit framework	Exceptions and traceable decisions

Credit model

(Model kredit)

Demo: 1 credit per automatic chase or delivery check. Each charge is logged.

Integration is simulated in the MVP. This is the proposed platform fit, not a completed production connection.

AI, database and cloud deployment

Responsive web UI	English, Bahasa Melayu and Chinese
Python + Flask	Order rules, permissions and application logic
Relational database *(Pangkalan data)*	SQLite records for orders, suppliers, logs and credits
DeepSeek API	Multilingual supplier-message extraction
Replit cloud *(Pengehosan awan)*	Deployed web prototype on a Reserved VM

RunPod: comparison testing on 6 synthetic replies. Live inference: DeepSeek API.

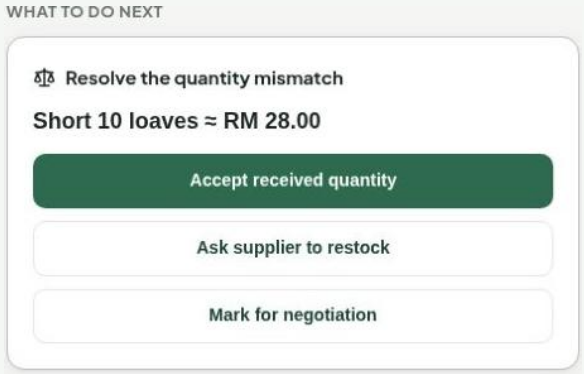

Expected impact and SDG 8 targets

SDG 8

(Pekerjaan layak dan pertumbuhan ekonomi)

8.2 Productivity through technology
8.3 Support for small enterprise growth

Phase 2 validation	Target, not achieved results
Preventable order loss	25% reduction
Manual follow-up time	20% reduction

Less chasing. More attention to the shop.

Improvements after mentor feedback

Added a “how it works” explanation

Helps a new merchant understand the workflow.

Simplified the dashboard

Makes urgent exceptions easier to find.

Redacted personal data before AI calls

Limits information sent to the model.

Next steps

Test with 3–5 merchants

Measure time and shortage baselines

Validate real Orbyte and messaging integration

Mentor review: 23 October 2026. On AI failure or timeout, keyword rules provide a limited fallback.
