RunPod Proof of Use - Sudahsampai

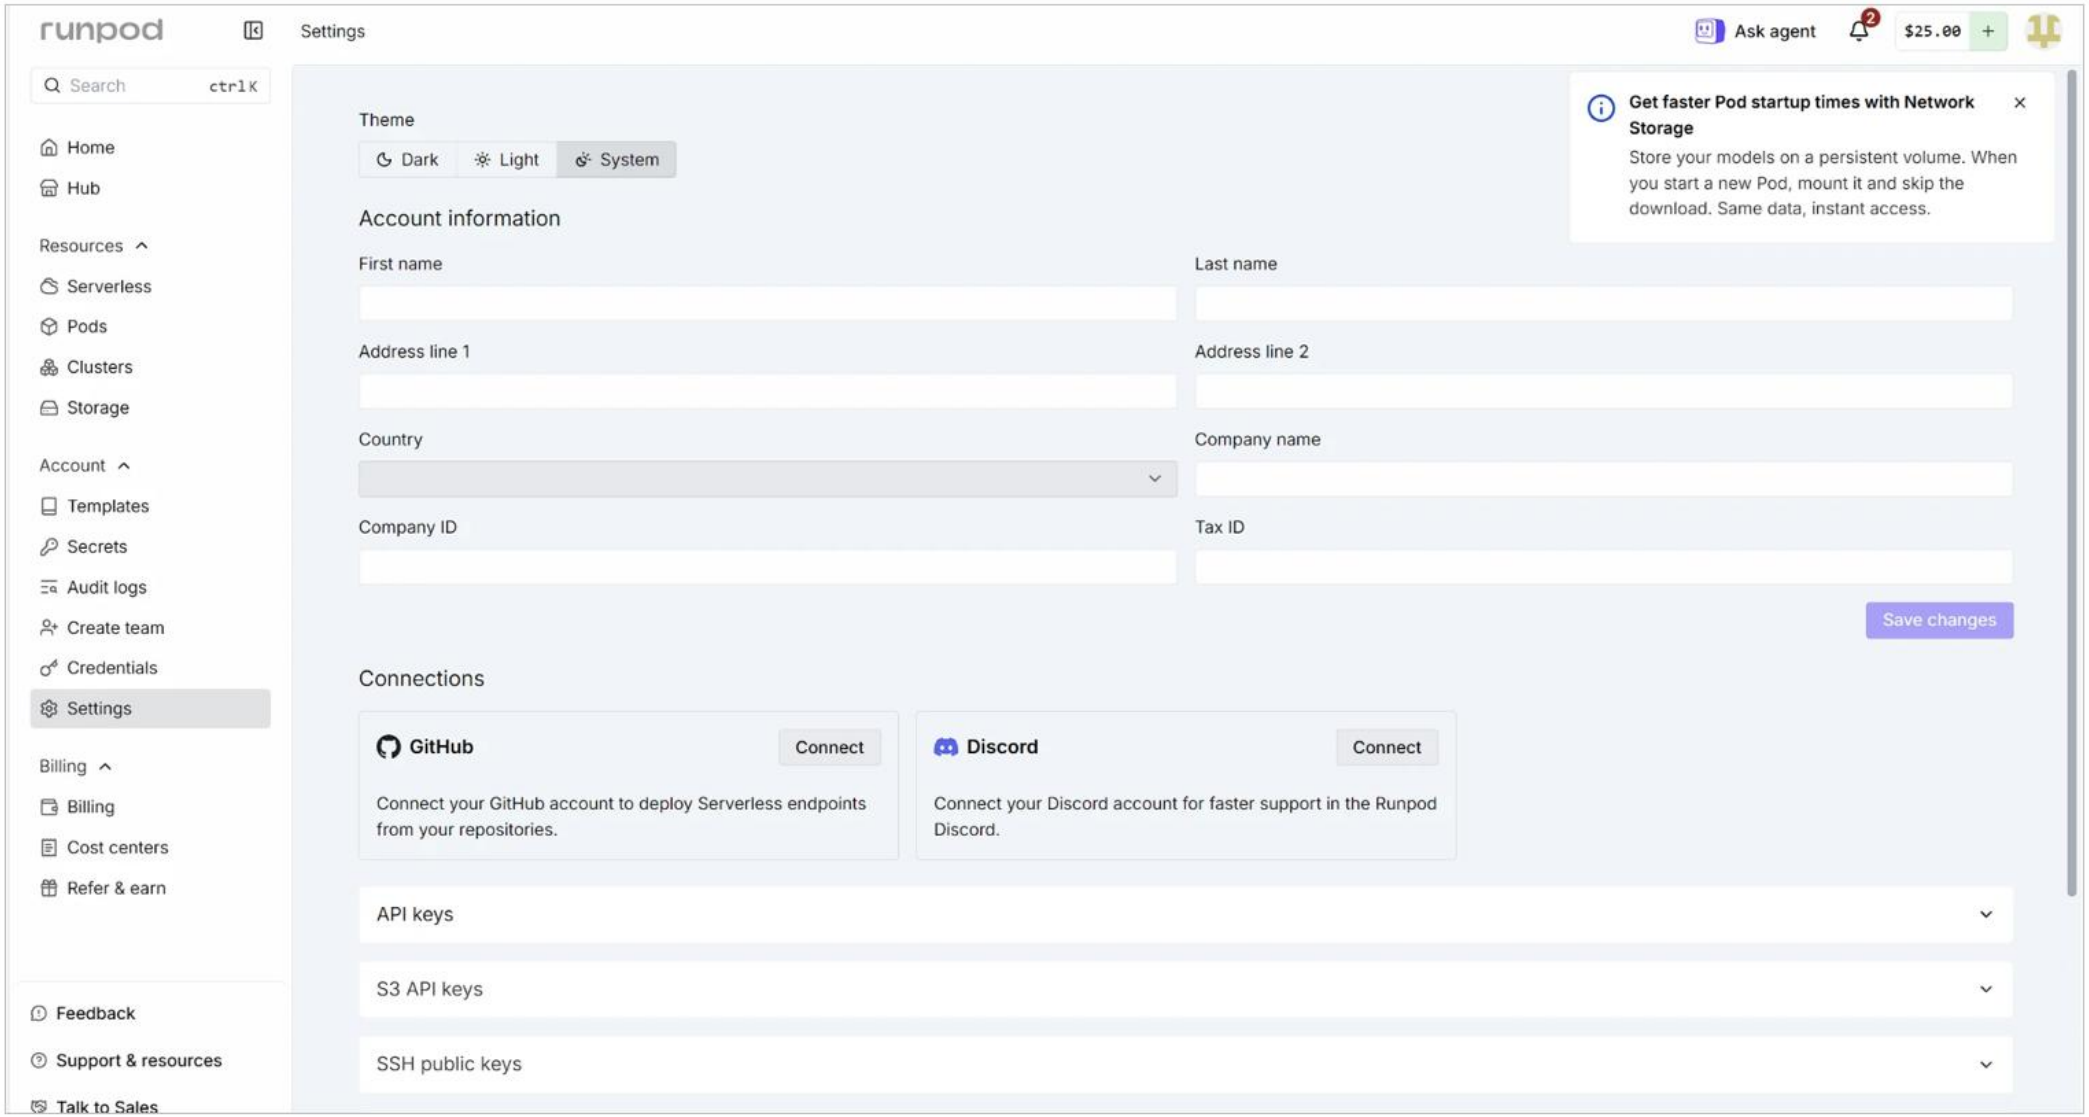

Team 200 OK FOUND, SDC Hackathon 2026, Domain 2 (Orbyte Smart SME Challenge).

How we used RunPod:
- Our app does not need a GPU. We used the RunPod public endpoint for GLM-5.3, paid with the competition credits, only for a one-off model comparison.
- scripts/compare_models.py ran the same 6 synthetic supplier replies against DeepSeek (deepseek-chat) and RunPod (glm-5.3), simulated date 2026-10-21.
- Result: both answered 6/6 with AI and flagged 1 reply for a human check. Average time: DeepSeek 1.12 s, GLM-5.3 4.39 s.
- On 'Lori rosak. Jumaat baru boleh hantar, 12 kotak je dulu' DeepSeek returned partial (12 boxes), GLM-5.3 returned delay.
- We chose DeepSeek for the live app. Switching only needs the AI_* environment variables. Small test (6 replies, one run each).

The following pages are unedited screenshots taken by the team on 23 Oct 2026. API keys are not visible.

1. RunPod account with the competition credit

RunPod console after redeeming the competition credit code: balance US$25.00 (top right).

2. compare_models.py output: RunPod GLM-5.3

Run with AI_BASE_URL set to the RunPod public endpoint and AI_MODEL=glm-5.3: 6/6 answered by AI, average 4.39 s, 1 needs human check.

3. compare_models.py output: DeepSeek (for comparison)

Same script and replies with DeepSeek (deepseek-chat): 6/6 answered by AI, average 1.12 s, 1 needs human check. The key was typed into a hidden prompt (shown as ****).
