1.TEAM AND PROJECT OVERVIEW

Team Name :200 OK FOUND

Selected Domain: Domain 2-Orbyte Smart SME Challenge: Less Busywork, Better Business (Alpha Red Solutions Sdn Bhd)

Selected SDG Track: SDG 8 -Decent Work and Economic Growth

Project name ： Sudahsampai

Leader: ZHU KUNLIANG

Email: EEE2609083@xmu.edu.my

University Affiliation: Xiamen University Malaysia

Number of Team Members:4

2. EXECUTIVE SUMMARY & PROBLEM STATEMENT

2.1 The Problem Context

Malaysian micro and small food retailers face heavy manual work in supplier order management. Business owners must follow up on purchase orders, check supplier replies, confirm deliveries, and resolve quantity discrepancies every day. Supplier communications often mix English, Bahasa Melayu, and Chinese, which increases the effort of cross-checking order details manually.

Without dedicated procurement tracking tools, small merchants commonly miss delivery delays, quantity shortages, price changes, and stock exceptions. These issues cause direct financial losses, inventory gaps, and operational inefficiency. Many existing business systems focus on internal management functions but lack native supplier order-tracking capabilities. As a result, merchants continue to rely on spreadsheets, chat messages, and manual reminders, making it difficult to track order statuses, prove disputes, or prevent avoidable losses.

2.2 The Proposed AI Solution

Our proposed solution, Sudahsampai, is a multilingual supplier order-tracking module designed to integrate with Orbyte. It adds native procurement-tracking capability to Orbyte while reusing Orbyte’s existing account management, communication, approval workflow, and audit log

framework. The system does not duplicate Orbyte's HR or administrative functions.

Sudahsampai follows a five-step workflow: trigger, data ingestion, AI judgement, merchant approval, and logging. When supplier replies are received, GenAI parses multilingual messages in English, Bahasa Melayu, and Chinese, then extracts new dates,quantities and prices, which rules compare with the order to flag delays and shortages. The AI acts only as an identifier and flagger; it does not make business decisions automatically.

Low-risk updates, such as delivery confirmations or minor status changes, can be auto-updated with merchant configuration. High-risk anomalies, especially those involving financial loss or quantity mismatch, require manual approval before any order record is updated. Approved actions and user decisions are recorded in a filterable activity audit log for dispute tracing.

The system also includes a credit-based operation model, where credits are deducted for automated follow-ups and goods verification. Built with GenAI APIs, a lightweight relational database, and cloud hosting, Sudahsampai reduces manual checking effort, surfaces priority exceptions, and helps small retailers prevent stock and financial losses.

The MVP will provide a central dashboard, new order creation, multilingual supplier-message parsing, exception flags, manual approval controls, and a traceable activity log, demonstrating a practical AI-powered module rather than a theoretical proposal.

Only the owner can approve or revert updates, while staff may only log deliveries. Offline keyword rules activate on AI failure or timeout, and personal data is redacted prior to AI calls.

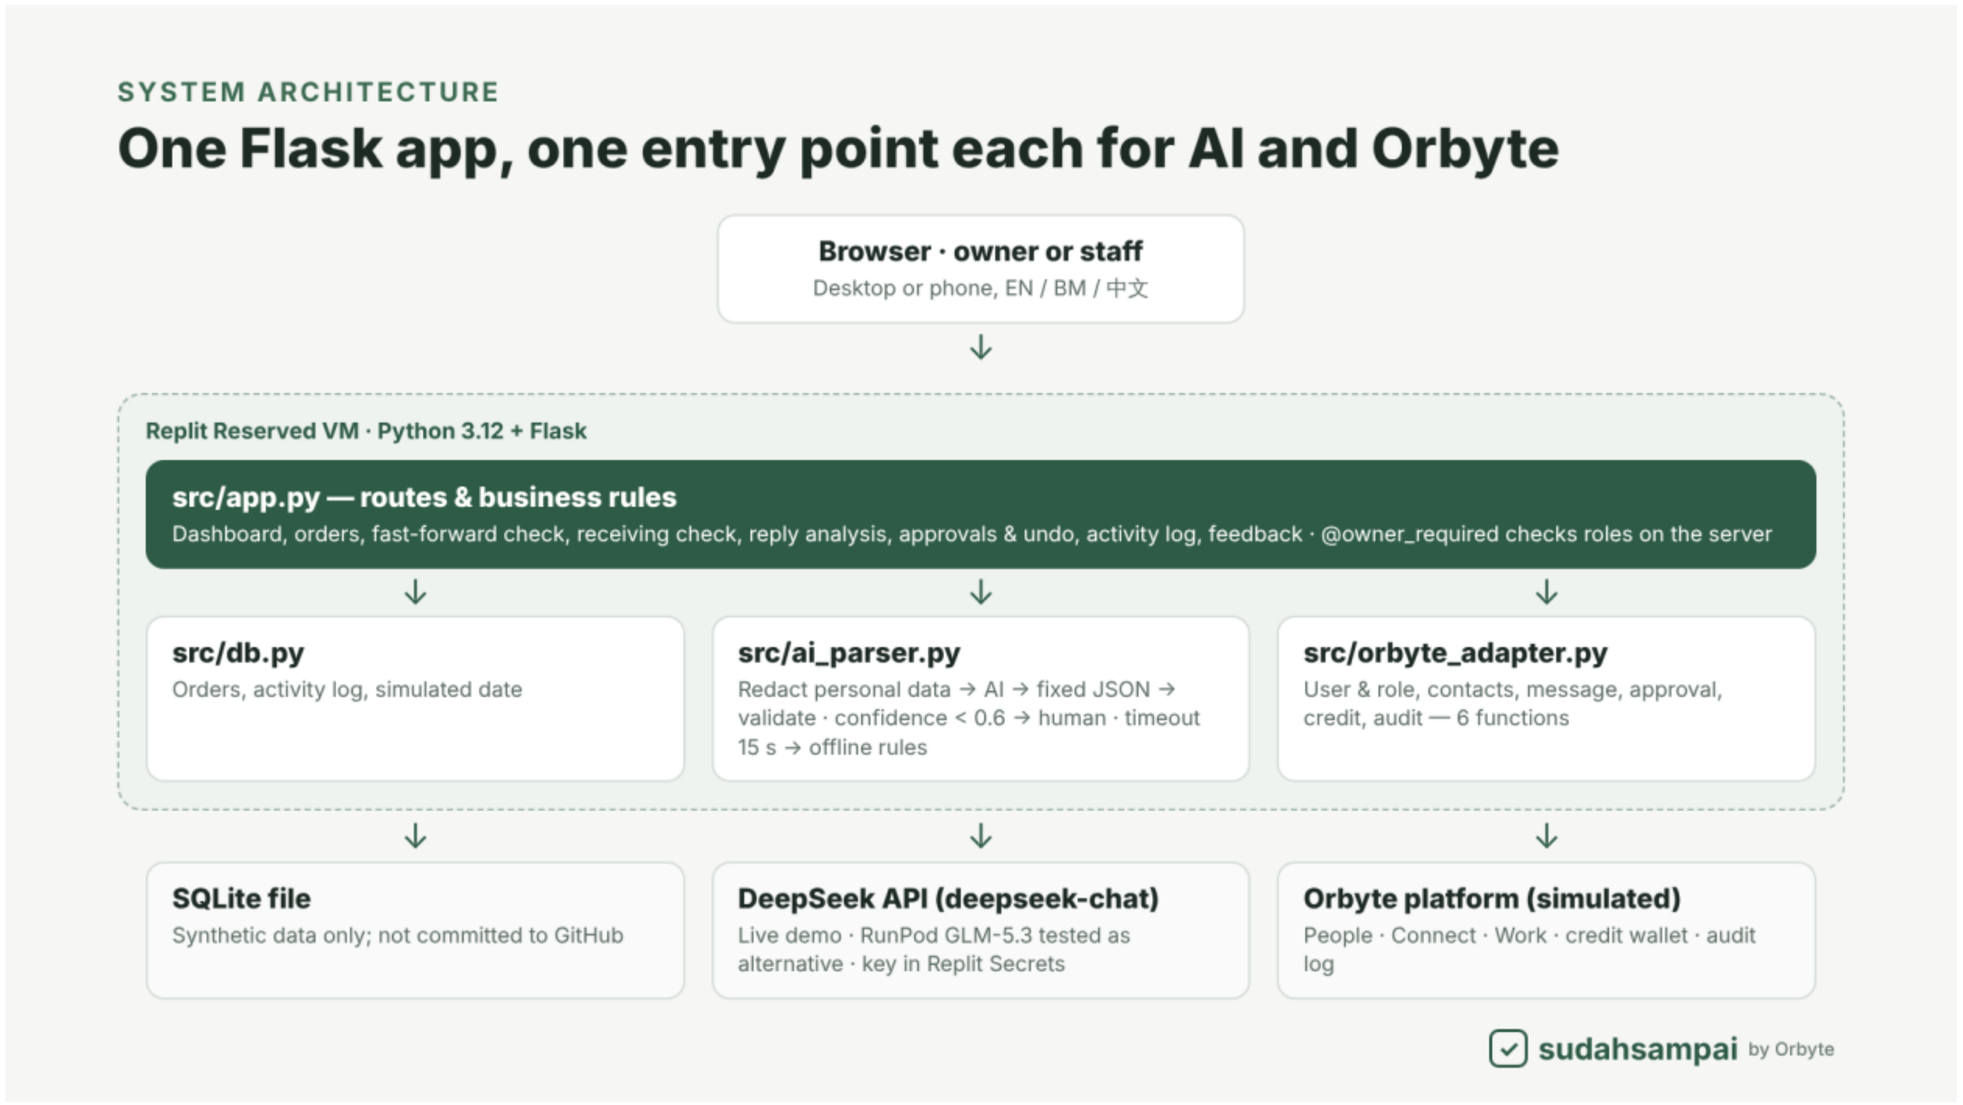

3.TECHNICAL ARCHITECTURE&IMPLEMENTATION PLAN

3.1 Conceptual Tech Stack

- Front-end: Web responsive UI (Replit hosting environment)
- Back-end: Python 3.12 + Flask ; AI
- AI Component: DeepSeek API (deepseek-chat), called through the OpenAI-compatible Python library
- Database: Relational database for storing supplier records, purchase orders, status logs and user credits

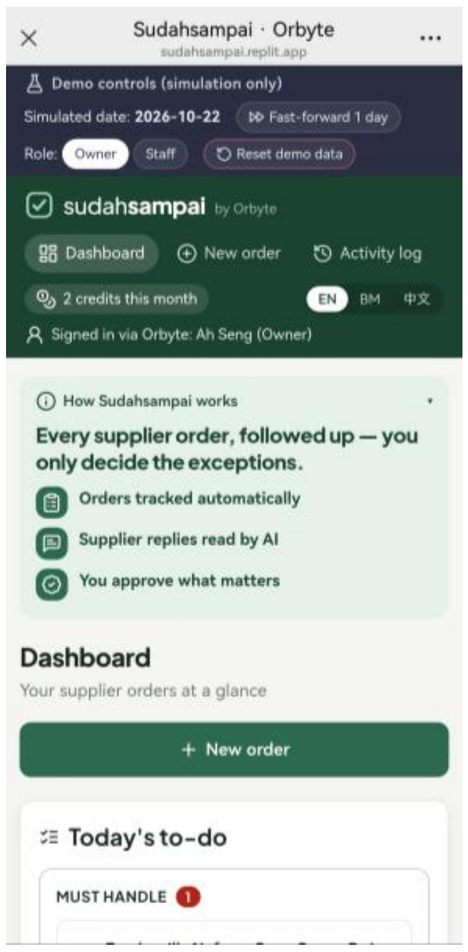

- Cloud & Hosting: Replit cloud deployment for live web prototype
- UI Language: English, Bahasa Melayu, Simplified Chinese

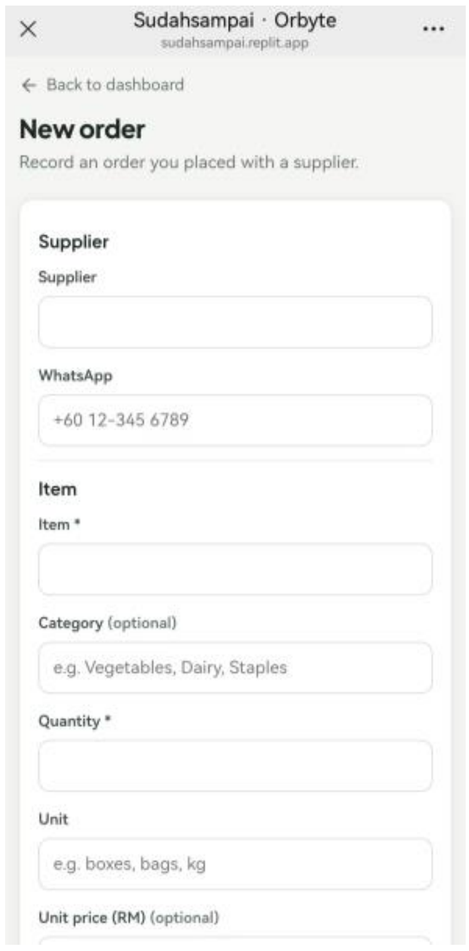

Did your project utilize any official SDC sponsor-provided GenAI API or Cloud Platform? If yes, specify which one and how it is used.
Yes. Replit (sponsor): development and live deployment of our prototype (Reserved VM). RunPod (sponsor credits): we tested the GLM-5.3 public endpoint against DeepSeek on 6 synthetic supplier replies; DeepSeek was chosen for the live demo. DeepSeek API is our own paid service.

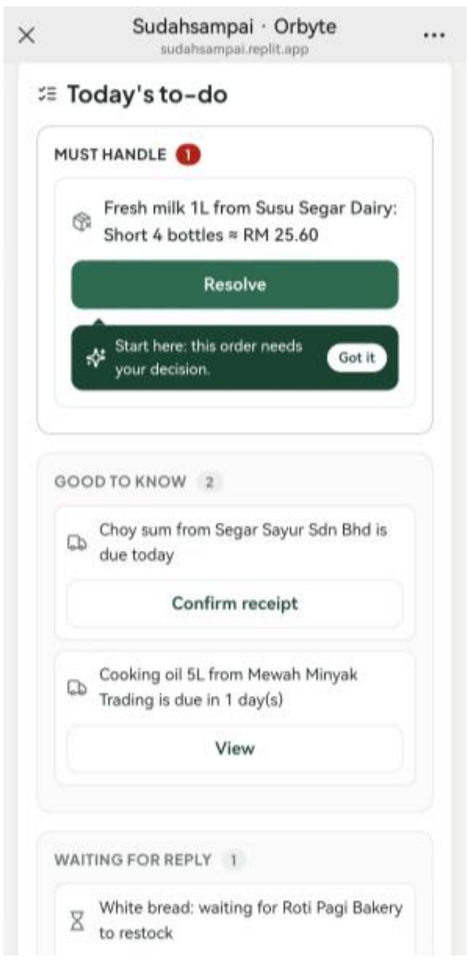

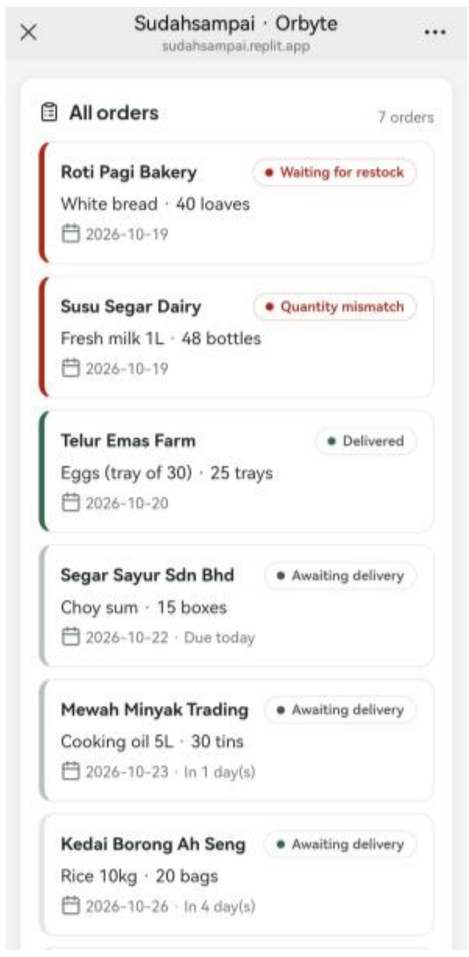

Core Functionnal Modules

- Multilingual priority dashboard: Supports English/BM/Chinese. Categorizes tasks: must-handle, good-to-know, waiting for supplier replies for fast issue spotting.
- New purchase order entry: Digitize offline orders with supplier, item, quantity and price details.
- Central order status management: Displays all orders with tags: quantity mismatch, awaiting delivery, delivered, waiting for restock.
- Activity audit log: Logs all system events, filterable by order ID for dispute tracing.

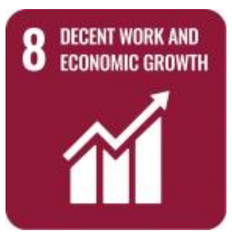

3.2 Design Thinking & Deployment Strategy

We adopted design thinking centered on local Malaysian micro merchant pain points.Define: core pain is repetitive multi-language order chasing and manual discrepancy checking. Ideate: minimize user workload by auto processing routine tasks and only surfacing exceptions. Prototype: build lightweight web UI focused on clear to-do lists instead of complex menus. Test: On 23 Oct a mentor reviewed our live prototype; we then added a "how it works" banner, simplified the dashboard and redacted personal data before AI calls.

4. PRELIMINARY ENVIRONMENTAL & SDG IMPACT FRAMEWORK

Metric Category	Your Response
Target SDG Sub-Target（s）	Target 8.2: Achieve higher levels of economic productivity through diversification, technological upgrading and innovation, including through a focus on high-value added and labour-intensive sectors. Target 8.3: Promote development-oriented policies that support productive activities, decent job creation, entrepreneurship, creativity and innovation, and encourage the formalization and growth of micro-, small- and medium-sized enterprises
Current Problem Baseline	Baseline to be measured in Phase 2 with 3-5 merchants (weekly hours on supplier follow-up; RM value of short deliveries per month). In our synthetic demo, the system flags each short delivery with its RM value at receiving (e.g. short 5 boxes ≈ RM 90).
Core Measurable KPI	RM value of preventable financial losses identified; time saved per week on supplier order follow-up (hours)
Phase 2 Impact Target	Achieve 25 % reduction in preventable order-related financial loss for test merchant users; cut manual order-follow-up labor time by 20 %

5. ELIGIBILITY & READINESS CHECKLIST

☑ All team members have completed the mandatory GenAI, Database, and Cloud Deployment upskilling workshops.

☐ The project concept addresses a verified real-world problem mapped directly to one or more UN SDGs.

☑ The proposed solution targets a functional, deployed application rather than a theoretical business case study.

☑ All fields in this template have been completed within the word limits stated.

6.1 Pre-Existing / Prior-Owned Work

Does this submission include any code, design, research, or other work that any team member created or owned before the start of this hackathon? ☐ Yes ☑ No If yes, briefly describe what was pre-existing and which team members) owned it: [Leave blank if No]

6.2 Third-Party Code, Datasets, or Models

Does your project use any third-party code libraries, open-source frameworks, public/private datasets, or pre-trained AI models that your team did not create? ☑ Yes ☐ No

Type	Name
Code	Flask 3(with Jinja2,Werkzeug)
Code	openai Python library
Code	Lucide icons 0.469.0（CDN）
Code	Python 3.12 standard library,SQLite
Model	DeepSeek deepseek-chat（API）
Model	GLM-5.3 by Z.ai（via RunPod public endpoint）
Dataset	None-all orders and supplier replies are synthetic, created by the team

6.3 Employment-Related IP Conflicts

Is any team member currently bound by an employment, internship, or consulting agreement under which their employer could claim ownership of work they create during this hackathon? ☐

Yes ☑ No

If yes, please describe the nature of the agreement and which member it concerns:

7. DECLARATION

By submitting this proposal, the team leader confirms that the information provided is accurate to the best of the team's knowledge and that the project will be original work created during the SDC 2026 hackathon period.
